

ABSTRACT

[0084] A glass plate minimizing distortions of reflected images while maintaining a low coefficient of heat transmission is provided. In a glass panel comprising a pair of glass plates (1) arranged to define a void (V) between opposed faces thereof, and a sealing member provided in outer circumference of the pair of glass plates for sealing the void (V), with the void (V) being decompressed, at least one glass plate (1A) of the pair of glass plates (1) has an outer surface bonded to a plate-shaped member in unison through an adhesive layer (X).
